

ABSTRACT

In order to provide a vibration-isolating device having a stopper mechanism to an excessive displacement of a vibration-isolating base in upward and horizontal directions with a light weight and a low cost, an inner cylinder (16) and an attachment member (12) with an opening (24) surrounding it are connected by a rubber-like elastomer (14), a cylindrical portion (32) is extended downwardly from the opening (24) to form a stopper rubber (36) between the cylindrical portion and the inner cylinder (16), while ensuring a clearance gap (38) thereby providing a first stopper part (40) limiting a horizontal displacement of the inner cylinder (16); and an extension portion (46) extending from a lower end of the inner cylinder (16) outwardly is provided to form a stopper rubber (48) between the extension portion and a lower end of the cylindrical portion (32) while ensuring a clearance gap (50) thereby providing a second stopper part (52) limiting an upward displacement of the inner cylinder (16).
